

IN THE ABSTRACT:

Please amend the Abstract of the Disclosure as follows:

--A recording medium is stably conveyed to a sheet feeding roller when sheet is supplied from an automatic sheet supplying section, and when the recording medium is conveyed to an automatic reversing section for reversing a sheet, stable conveyance is made possible without contaminating a recorded result without abutment of a recorded surface to a sheet passing path.

A first sheet passing path from an automatic sheet supplying section to a recording section and a second sheet passing path leading to an automatic reversing section from the recording section and leading to the recording section from the automatic reversing section share a part of them with each other, and the shared sheet passing path is provided with a guide member movable from a first position for the first sheet passing path to a second position for the second sheet passing path in synchronism with separation of a pinch roller from a sheet feeding roller.--
